D. KIRAN KUMAR

📍 **Location**: Bangalore
📱 **Mobile**: 7330651797
📧 **Email ID**: *dkirankumar0410@gmail.com*

CAREER OBJECTIVE:
To secure a challenging position as a **Big Data Engineer** where I can apply my skills in **data engineering, cloud technologies, and analytics** to develop scalable data solutions, generate actionable insights, and contribute to the organization's growth and success.

PROFILE SUMMARY:

- 6+ years of professional experience as a **Big Data Engineer** in designing and developing scalable ETL pipelines and big data solutions.
- Strong expertise in **Apache Spark**, **PySpark**, **Hive**, **SQL**, and **Python**.
- Hands-on experience working with **cloud platforms** including **AWS** (S3, Glue, Redshift, Lambda), and **Azure** (Data Lake, Synapse, Databricks).
- Experience in building **data lakes**, data warehouses, and real-time analytics platforms.
- Well-versed with **data ingestion, transformation, validation, and processing** using PySpark and Spark SQL.
- Proficient in **Unix/Linux shell scripting** and managing data workflows on cloud.
- Good knowledge of **data warehousing concepts**, **ETL development**, and **data modelling**.
- Skilled in version control systems like **GitHub** and **Bitbucket**.
- Experience working in **Agile/Scrum** methodologies and cross-functional teams.
- Used **Apache Airflow** and **AWS Lambda** for orchestration and automation.
- Adept at working with structured, semi-structured (JSON, XML), and unstructured data.
- Strong debugging and optimization skills for big data pipelines.
- Experience in integrating **business intelligence** tools with cloud data sources.
- Exposure to **DevOps practices** and CI/CD for data pipeline deployments.
- Collaborative team player with strong communication and problem-solving skills.

- Consistent record of meeting project deadlines and exceeding performance metrics.
- Capable of learning new tools and technologies quickly in dynamic environments.

EDUCATION

Bachelor of Commerce (B. Com)
Sri Krishna Devaraya University, Andhra Pradesh
2015 – 2019

PROFESSIONAL EXPERIENCE

Globus Info Services Pvt Ltd. – Bangalore
Big Data Engineer
Duration: August 2019 – July 2025

TECHNICAL SKILLS

- **Operating Systems**: Windows, Unix/Linux
- **Big Data Technologies**: Spark, Hive, PySpark, SCALA, Unix
- **Programming Languages**: Python, SQL, Scala
- **Databases**: Oracle, MySQL, SQL
- **IDE Tools**: Eclipse, PyCharm
- **Version Control**: GitHub, Bitbucket
- **Cloud Platforms**:
    - **AWS**: S3, Glue, Redshift, Lambda
    - **Azure**: Data Lake, Synapse, Databricks

PROJECTS

Project 1: Supply Chain Optimization

- **Client**: Confidential (Supply Chain Domain)
- **Project Name**: End-to-End Data Lake Implementation for Supply Chain Analytics

- **Environment**: PySpark, SQL, AWS Glue, S3, Redshift, Lambda, Airflow, Python, Azure
- **Team Size**: 8
- **Duration**: August 2022 – July 2025

Project Description:

The project aimed to design and implement an **end-to-end data lake solution** to improve supply chain efficiency and analytics. The system integrated data from multiple sources, transformed it using **PySpark and AWS Glue**, and stored it in **Amazon Redshift** for advanced analytics and visualization. Automated workflows were built using **Apache Airflow** and **AWS Lambda**, enabling real-time insights into inventory management, order fulfilment, and demand forecasting. This implementation enhanced data accessibility, reduced latency, and supported data-driven decision-making across global supply chain operations.

Roles & Responsibilities:

- Designed and developed data ingestion pipelines using **AWS Glue** and **PySpark** to extract and load data from multiple sources into **S3**.
- Implemented **ETL** transformations in **PySpark** to clean, **standardize**, and enrich large datasets for analytical use.
- Built automated workflows using **Apache Airflow** for scheduling, monitoring, and managing **data pipelines**
- Optimized **Redshift data** models and queries for high performance and scalability.
- Developed Lambda functions for **event-driven data processing** and **pipeline automation**.
- Ensured data quality, validation, and consistency across multiple data sources and target systems.
- Collaborated with cross-functional teams to define data requirements and business **KPIs** for supply chain **analytics.**
- Integrated **AWS** and **Azure services** for hybrid **cloud** data management and scalability.
- Implemented data security and governance policies following best practices in IAM, encryption, and access control.
- Created monitoring dashboards and audit logs for pipeline performance, **data freshness**, and error tracking.

Project 2: Predictive Maintenance for Industrial Equipment

- **Project Name**: IoT-Based Predictive Maintenance Analytics
- **Environment**: PySpark, SQL, Data Warehousing, ETL, Airflow, AWS, Python
- **Team Size**: 6
- **Duration**: January 2021 – July 2022

Project Description:

The project focused on developing an **IoT-driven predictive maintenance platform** that leveraged real-time sensor data from industrial equipment to forecast potential failures and optimize maintenance schedules. The solution involved building robust **ETL pipelines** to process and store high-velocity IoT data, enabling data-driven insights through advanced analytics and machine learning models. By integrating **AWS cloud services** with **PySpark-based data processing**, the system significantly reduced equipment downtime, improved operational efficiency, and lowered maintenance costs.

Roles & Responsibilities:

- Designed and implemented **data ingestion pipelines** to collect and process real-time IoT sensor data from industrial machinery.
- Developed **PySpark-based ETL processes** for cleaning, transforming, and aggregating high-volume streaming data.
- Built and maintained **data warehouse structures** to support analytical queries and predictive modelling.
- Automated **data workflows and scheduling** using Apache Airflow for seamless end-to-end pipeline execution.
- Collaborated with data scientists to provide **curated and feature-engineered datasets** for model training and validation.
- Implemented **data validation, quality checks, and monitoring** to ensure accuracy and reliability of sensor data.
- Integrated **AWS cloud services** (S3, Lambda, Redshift) for scalable storage, compute, and data access management.
- Optimized **SQL queries and data warehouse performance** to improve data retrieval efficiency.
- Participated in **root-cause analysis** by correlating sensor data patterns with equipment failure events.
- Created **dashboards and reports** to visualize maintenance predictions, asset health, and operational KPIs for stakeholders.

Project 3: Real-time Customer Sentiment Analysis for Retail

- **Client**: Confidential (Retail Sector)
- **Project Name**: Customer Feedback and Sentiment Analysis
- **Environment**: Spark, SQL, Python, Azure, AWS Glue, Linux, Cloud
- **Team Size**: 5
- **Duration**: January 2020 – December 2020

Project Description:

The project aimed to build a **real-time sentiment analysis platform** to analyze customer feedback from multiple channels, including social media, surveys, and product reviews. The system leveraged **big data processing using Spark** and **Python-based NLP techniques** to identify sentiment trends and customer satisfaction levels. The solution was deployed on **cloud infrastructure (Azure & AWS)**, enabling real-time analytics dashboards for marketing and product teams. This helped the client enhance customer engagement, improve product quality, and make data-driven business decisions.

Roles & Responsibilities:

- Designed and developed **data ingestion pipelines** to capture customer feedback data from APIs, social media, and review platforms.
- Implemented **real-time data processing** using Spark Streaming for continuous sentiment analysis.
- Developed **Python scripts** for text preprocessing, tokenization, and sentiment scoring using NLP libraries.
- Created and managed **ETL workflows** using AWS Glue for data extraction, transformation, and loading into cloud storage.
- Built **SQL-based data models and analytical queries** to support reporting and visualization.
- Deployed and maintained **cloud infrastructure** on Azure and AWS for scalable and secure data processing.
- Integrated **sentiment analytics results** with BI dashboards to visualize customer mood trends and satisfaction metrics.
- Optimized **Spark jobs and data partitioning** to improve performance and reduce processing time.
- Implemented **data quality checks, monitoring, and logging** to ensure accuracy of sentiment classification.
- Collaborated with business analysts and data scientists to interpret results and deliver actionable insights for marketing and product improvement.
