HARICHAKRAPANI KALLURU

Consultant
HCLTech – Chennai.
Phone:7013532172
Email: harichakra691@gmail.com

PROFILE SUMMARY:

- ETL Developer with over 6 years of experience designing and implementing scalable data pipelines using Snowflake, DBT Cloud, DataStage, and Informatica PowerCenter, IICS/IDMC. Demonstrated success in leading offshore teams, mentoring junior developers, and delivering impactful data solutions. Proficient in integrating data from diverse sources, including Oracle, DB2, SQL Server, and Teradata SQL, with a strong emphasis on data quality and performance optimization.
- Contributed to both support and development projects, delivering robust ETL solutions.
- Proficient in ETL methodologies, including data extraction, transformation, and loading from diverse sources such as flat files, CSVs, and relational tables.
- Extensive experience with Informatica PowerCenter transformations, including Source Qualifier, Lookup, Filter, Expression, Router, Joiner, Update Strategy, Rank, Aggregator, Sorter, Stored Procedure, and Sequence Generator.
- Strong expertise in SQL and UNIX environments.
- Skilled in designing and developing workflows, sessions, and tasks using Informatica Workflow Manager tools (Task Developer, Workflow & Worklet Designer) to manage various load scenarios.
- In-depth experience with Slowly Changing Dimensions (Type I and Type II).
- Highly proficient in creating, executing, and debugging Informatica mappings, mapplets, sessions, tasks, worklets, and workflows.
- Proficient in performance tuning techniques to optimize ETL processes for enhanced efficiency and speed.
- Collaborative team player with excellent communication, analytical, and interpersonal skills, coupled with a strong ability to adapt and learn new concepts.
- Developed and optimized Snowflake SQL queries for data extraction, transformation, and loading operations.
- Loading data into snowflake tables from the internal stage using Snow SQL (CLI).
- Used COPY, LIST, PUT, GET commands for validating the internal staged files.
- Extracting the source data from AWS-S3 Buckets and Local files and loaded into Snowflake.
- Created an external stage in Snowflake to define the connection to the S3 bucket with S3 storage integration.
- Writing the appropriate SQL statements to load data from the S3 bucket into Snowflake.
- Bulk data loading from the external stage (AWS S3), internal stage to snowflake cloud using COPY INTO command.
- Creating and monitoring SNOW PIPE for continuous data ingestion from S3 bucket.
- Data importing and exporting from internal / External stage to Snowflake.
- Performing the Data validations through the Snowflake information schema.
- Used Flatten table function to produce a lateral view of Variant, Object, Array columns.
- Applying any transformations or formatting required for the data during the load process.
- Monitor and optimize the data loading process for performance and efficiency.
- Performed basic transformation and joins on the temporary table data as per requirement.
- Creating and redesigning the View / Materialized views in snowflake as per the requirements.
- Creating Streams in Snowflake to record data manipulations (SCD type-2) of Tables.
- Implemented scheduled query jobs and stored procedures in Snowflake using TASK.
- Designing the table schema in Snowflake that matches the structure of the data to be loaded.
- Worked on Mapping, Mapping task, Task flows in IDMC

- Passing the values from one mapping task to other mapping task.
- Worked on different connectors like AWS S3 Connector, Oracle, Flat File, Rest V2 and Teradata Connectors.
- Worked on Input Parameter and In-Out Parameter and Flow run Order.
- Worked on different type of tasks like Mapping, Replication and Synchronization and Power Center tasks
- Involved in improve the performance of IDMC Jobs using transformation wise and partition.
- Worked on dynamic files creation based on client requirement in IDMC.

Education:

Course	Board/University
Bachelor Of Technology(ECE)	Gitam University, Visakhapatnam.

Technical Expertise:

- **Programming Languages** : SQL, Unix Shell Scripting
- **Database** : Oracle, DB2, MS SQL Server, Snowflake Cloud DB, Teradata
- **Tools/Software/Framework** : Informatica Powercenter, DBT, IBM DataStage, Control-M, Autosys

CERTIFICATIONS:

Certification	Provider
SnowProCore	Snowflake
SQL (Basic and Intermediate)	Hacker Rank
DBT Fundamentals	DBT Labs
IICS	Informatica University

Organization: **HCLTech 2023 MAY TO TILL DATE**
Project Domain: Banking and Financial Services.
Technologies: Snowflake, DBT, DataStage, UNIX, GIT, Shell Scripting, VS Code
Description: Extract data from multiple heterogeneous sources, transformed it using ETL processes, and loaded it into Snowflake data warehouse tables to support business intelligence and reporting needs.

Roles and Responsibilities:

- Worked on a banking domain project focused on handling credit card disputes and fraud-related data for analytics and reporting teams.
- Extracted data from various heterogeneous sources including mainframe files, SQL Server, and DB2 tables, using IBM DataStage ETL jobs.

- The extracted data was staged into Snowflake's initial layer in JSON format via PySpark scripts, enabling efficient handling of semi-structured data.
- Designed and implemented a multi-layer Snowflake architecture:
    - Layer 1 (Stage) – Raw JSON data was loaded daily.
    - Layer 2 (Integration) – Applied transformations, business rules, and complex joins.
    - Layer 3 (Target/History) – Maintained historical snapshots for downstream reporting and auditing.
- Developed data transformation and flattening logic using DBT (Data Build Tool), with DBT SQL models stored and version-controlled in Git.
- Automated the entire pipeline using Control-M scheduler, ensuring timely daily loads and reducing manual intervention.
- Followed best practices in ETL job orchestration, error handling, and performance optimization to ensure data integrity and high availability.
- Extract, Transform, Load (ETL/ELT): Design and implement ELT pipelines to extract data from heterogeneous sources and load it into Snowflake, leveraging dbt for transformation logic.
- Create and maintain dbt models (SQL-based) to transform raw data into structured, analytics-ready datasets, using dbt's modular approach for staging, intermediate, and mart layers.
- Manage incremental and historical data loads in Snowflake, optimizing for performance and cost-efficiency using dbt's incremental modeling capabilities.
- Performance Optimization: Optimize Snowflake performance through clustering keys, partitioning, and query tuning to ensure efficient data processing and cost management.
- Write modular, reusable SQL-based dbt models to transform raw data into analytics-ready tables, incorporating business logic for metrics like customer analytics, revenue forecasting, or operational KPIs.
- Implement dbt tests (e.g., uniqueness, not-null, referential integrity) to ensure data quality and reliability, aligning with validation practices like primary key, attribute, and duplicate tests.

Organization: **Capgemini 2021 OCT TO 2023 APR**
Project Domain: Hospitality and Leisure.
Technologies: Informatica Powercenter, Oracle, UNIX, GIT, Shell Scripting,
Description:

Royal Caribbean Cruises Ltd. (RCCL), a global leader in the cruise industry with over 60 ships across brands like Royal Caribbean International, Celebrity Cruises, and Silversea, relies on a robust data warehouse and ETL (Extract, Transform, Load) processes to manage vast amounts of data generated daily. This infrastructure supports business intelligence (BI), customer analytics, network optimization, revenue forecasting, and real-time decision-making to enhance guest experiences and operational efficiency.

Roles & Responsibilities:

- Gathered requirements and conducted business analysis, translating functional specifications from the data architect into detailed technical specification documents for all mappings.
- Extracted source definitions from databases such as Oracle into target tables using Informatica Mappings and Sessions.
- Designed complex mappings with embedded business logic using Informatica PowerCenter, incorporating transformations like Lookup, Joiner, and Source Qualifier in Informatica Designer.
- Delivered knowledge transfer to end users and created comprehensive documentation covering design, development, implementation, daily loads, and process flow of mappings.
- Collaborated with Data Modelers and Business Analysts to understand requirements and assess the impact of ETL processes on business operations.

- Extracted data from flat files and Oracle databases to build an Operational Data Source, applying business logic to load data into a Global Data Warehouse.
- Utilized transformations including Filter, Router, Expression, Lookup (connected and unconnected), Aggregator, Sequence Generator, Update Strategy, Joiner, Normalizer, Sorter, and Union to develop robust mappings in Informatica Designer.
- Developed complex Source Qualifier queries, as well as Pre and Post SQL queries for target databases.
- Managed tasks in Workflow Manager, including Sessions, Event Raise, Event Wait, Decision, and E-mail.
- Created and scheduled sessions and batches for incremental data loads into staging tables, configured to run daily.
- Conducted unit testing and created detailed Unit Test Documents with comprehensive test cases.
- Prepared migration documents to facilitate the movement of mappings from development to testing and production repositories.
- Handled both initial (history) and incremental data loading as part of ETL automation.
- Utilized Debugger Sessions to debug mappings, setting breakpoints for enhanced analysis of Informatica mappings.
- Provided knowledge transfer to new team members to ensure smooth onboarding.
- Performed query tuning, database tuning, performance tuning, and implemented various indexing methods.
- Worked with joins, subqueries, and complex query writing to support data processing needs.
- Performed validations including testing flat file data transfers for accuracy and reliability, writing SQL queries for scenarios like count tests, and conducting primary key, attribute, and duplicate tests to ensure data quality.
- Creating Informatica IICS mappings for the different plans using various transformations.
- Analysis of the specifications provided by the clients.
- Used Various Transformations such as Sorted, Lookup, Joiner, Aggregator, Sequence Generator. Lookup, Normalizer, Transaction Control Transformation.
- Worked on Different tasks like Mapping Task Replication Task, Synchronization Task, Power Center Task in IICS.
- Worked on Mapping, Mapping Task, Mapplet, Task Flows
- Worked on Synchronization task and replication, Dynamic mapping task.
- Knowledge on secure Agent and Run Time environment in IDMC.
- Worked on Input Parameter and in-Out Parameters in IDMC
- Passing the values from one mapping task to other mapping task in IDMC.
- Worked on different connectors like S3, Oracle, Flat File, Rest V2 and Teradata Connector in IDMC.

Organization: **Capgemini 2019 AUG TO 2021 OCT**
Project Domain: Telecommunications Services.
Technologies: Informatica Powercenter, Teradata, Oracle, UNIX

Description:

Generates vast amounts of data daily from heterogeneous sources like CRM systems, network management systems, billing platforms, and operational databases. These data types (CDR, Customer, Network Usage, Billing, Plans, and Usage) are critical for BI and reporting, such as customer analytics, network optimization, and revenue forecasting. The ETL process will extract data from these sources, transform it to ensure consistency and compliance (e.g., GDPR), and load it into Teradata, a high-performance data warehouse optimized for large-scale analytics and enterprise reporting.

Roles & Responsibilities:

- Gathered requirements and conducted business analysis, translating functional specifications from the data architect into detailed technical specification documents for all mappings.
- Extracted source definitions from databases such as Oracle into target tables using Informatica Mappings and Sessions.
- Designed complex mappings with embedded business logic using Informatica PowerCenter, incorporating transformations like Lookup, Joiner, and Source Qualifier in Informatica Designer.
- Delivered knowledge transfer to end users and created comprehensive documentation covering design, development, implementation, daily loads, and process flow of mappings.
- Collaborated with Data Modelers and Business Analysts to understand requirements and assess the impact of ETL processes on business operations.
- Extracted data from flat files and Oracle databases to build an Operational Data Source, applying business logic to load data into a Global Data Warehouse.
- Utilized transformations including Filter, Router, Expression, Lookup (connected and unconnected), Aggregator, Sequence Generator, Update Strategy, Joiner, Normalizer, Sorter, and Union to develop robust mappings in Informatica Designer.
- Managed and monitored ETL jobs using Control-M, overseeing daily and weekly data loads.
- Utilized various join types (Normal, Full Outer, Detail Outer, Master Outer) in Joiner Transformations for data integration.
- Performed pre-load checks to ensure readiness and post-load validations to confirm successful completion.
- Implemented Slowly Changing Dimensions (SCD) Type 1 and Type 2 to align with business requirements for maintaining historical and current data.
- Optimized performance at source, target, mapping, and session levels for efficient data processing.
- Executed and monitored ETL jobs in Control-M, ensuring reliable daily and weekly load operations.
- Utilized Teradata utilities such as MLOAD, FLOAD, and BTEQ for efficient data loading and manipulation in the Teradata data warehouse.
